

## WIA1002/WIB1002 Data Structure

### Lab: ADTs and Bags

#### Question 1

Given the interface BagInterface below:

```
/**
An interface that describes the operations of a bag of objects.
*/
public interface BagInterface<T>
{
    /** Gets the current number of entries in this bag.
        @return the integer number of entries currently in the bag */
    public int getCurrentSize();

    /** Sees whether this bag is full.
        @return true if the bag is full, or false if not */
    public boolean isFull();

    /** Sees whether this bag is empty.
        @return true if the bag is empty, or false if not */
    public boolean isEmpty();

    /** Adds a new entry to this bag.
        @param newEntry the object to be added as a new entry
        @return true if the addition is successful, or false if not */
    public boolean add(T newEntry);

    /** Removes one unspecified entry from this bag, if possible.
        @return either the removed entry, if the removal was successful,
            or null */
    public T remove();

    /** Removes one occurrence of a given entry from this bag.
        @param anEntry the entry to be removed
        @return true if the removal was successful, or false if not */
    public boolean remove(T anEntry);

    /** Removes all entries from this bag. */
    public void clear();

    /** Counts the number of times a given entry appears in this bag.
        @param anEntry the entry to be counted
        @return the number of times anEntry appears in the bag */
    public int getFrequencyOf(T anEntry);

    /** Tests whether this bag contains a given entry.
        @param anEntry the entry to locate
        @return true if this bag contains anEntry, or false otherwise */
    public boolean contains(T anEntry);

    /** Retrieves all entries that are in this bag.
```

```

    @return a newly allocated array of all the entries in the bag */
    public T[] toArray();
} // end BagInterface

```

Write an `ArrayBag` class that implement the `BagInterface`, as shown in the UML diagram below. Set the `DEFAULT_CAPACITY` to 25.

## Question 2

The union of two collections consists of their contents combined into a new collection. **Add a method** `union` to the interface `BagInterface` for the ADT bag that returns as a new bag the union of the bag receiving the call to the method and the bag that is the method's one argument. Include sufficient comments to fully specify the method.

Note that the union of two bags might contain duplicate items. For example, if object `x` occurs five times in one bag and twice in another, the union of these bags contains `x` seven times. Specifically, suppose that `bag1` and `bag2` are `Bag` objects, where `Bag` implements `BagInterface`; `bag1` contains the `String` objects `a`, `b`, and `c`; and `bag2` contains the `String` objects `b`, `b`, `d`, and `e`. After the statement

```
BagInterface<String> everything = bag1.union(bag2);
```

executes, the bag `everything` contains the strings `a`, `b`, `b`, `b`, `c`, `d`, and `e`. Note that `union` does not affect the contents of `bag1` and `bag2`.

**Implement** the `union` method in `ArrayBag` class.

**Question 3**

The intersection of two collections is a new collection of the entries that occur in both collections. That is, it contains the overlapping entries. **Add a method** `intersection` to the interface `BagInterface` for the ADT bag that returns as a new bag the intersection of the bag receiving the call to the method and the bag that is the method's one argument. Include sufficient comments to fully specify the method.

Note that the intersection of two bags might contain duplicate items. For example, if object `x` occurs five times in one bag and twice in another, the intersection of these bags contains `x` twice. Specifically, suppose that `bag1` and `bag2` are `Bag` objects, where `Bag` implements `BagInterface`; `bag1` contains the `String` objects `a`, `b`, and `c`; and `bag2` contains the `String` objects `b`, `b`, `d`, and `e`. After the statement

```
BagInterface<String> commonItems = bag1.intersection(bag2);
```

executes, the bag `commonItems` contains only the string `b`. If `b` had occurred in `bag1` twice, `commonItems` would have contained two occurrences of `b`, since `bag2` also contains two occurrences of `b`. Note that intersection does not affect the contents of `bag1` and `bag2`.

**Implement** the `intersection` method in `ArrayBag` class.

**Question 4**

The difference of two collections is a new collection of the entries that would be left in one collection after removing those that also occur in the second. **Add a method** `difference` to the interface `BagInterface` for the ADT bag that returns as a new bag the difference of the bag receiving the call to the method and the bag that is the method's one argument. Include sufficient comments to fully specify the method.

Note that the difference of two bags might contain duplicate items. For example, if object `x` occurs five times in one bag and twice in another, the difference of these bags contains `x` three times. Specifically, suppose that `bag1` and `bag2` are `Bag` objects, where `Bag` implements `BagInterface`; `bag1` contains the `String` objects `a`, `b`, and `c`; and `bag2` contains the `String` objects `b`, `b`, `d`, and `e`. After the statement

```
BagInterface leftOver1 = bag1.difference(bag2);
```

executes, the bag `leftOver1` contains the strings `a` and `c`. After the statement

```
BagInterface leftOver2 = bag2.difference(bag1);
```

executes, the bag `leftOver2` contains the strings `b`, `d`, and `e`. Note that difference does not affect the contents of `bag1` and `bag2`.

**Implement** the `difference` method in `ArrayBag` class.

### Question 5

Write a test program `ArrayBagDemo.java` to test the core methods `add`, `getCurrentSize()` and `toArray` of the class `ArrayBag`, and the three methods that you implemented in Question 2 to 4 (i.e. `union`, `intersection` and `difference`). Initially the main method creates an empty bag by using the default constructor. Since the capacity of the bag is 25, the array should not get full if you add fewer than 25 entries to it. Thus, `add` should return `true` after each of these conditions. The test program's descriptive output will indicate that the tested methods are correct.

#### In your program:

- a) Create a `private static method` named `testAdd` to test the method `Add` of `ArrayBag`:

```
private static void testAdd(BagInterface<String> aBag, String[] content)
```

- b) Create a `private static method` named `displayBag` to test the methods `getCurrentSize()` and `toArray` of `ArrayBag` while displaying the all the entries of the bag.

```
private static void displayBag(BagInterface<String> aBag)
```

- c) **The main method:**

- Create two (2) empty `ArrayBag` objects of the type array for a list of strings, named `bag1` and `bag2`.
- Then filling an initially empty bag, `bag1` and `bag2` with a list of strings using the method `testAdd`

```
String[] contentsOfBag1 = {"A", "A", "B", "A", "C", "A"};
String[] contentsOfBag2 = {"A", "B", "A", "C", "B", "C", "D", "another string"};
```

- Display the contents of `bag1` and `bag2` using method `displayBag`
- Test the `method union` using a new bag named `bag3` that combines the contents of `bag1` and `bag2`. Display the contents of `bag3` using method `displayBag`.
- Test the `method intersection` using a new bag named `bag4` that contains those objects that occur in both `bag1` and `bag2`. Display the contents of `bag4` using method `displayBag`.
- Test the `method difference` using a new bag named `bag5` that create a new bag of objects that would be left in `bag1` after removing those that also occur in `bag2`. Display the contents of `bag5` using method `displayBag`.

**An example of the output for the test program is as follows:**

```
bag1:
Adding A A B A C A
The bag contains 6 string(s), as follows:
A A B A C A

bag2:
Adding A B A C B C D another string
The bag contains 8 string(s), as follows:
A B A C B C D another string

bag3, test the method union of bag1 and bag2:
The bag contains 14 string(s), as follows:
A A B A C A A B A C B C D another string

bag4, test the method intersection of bag1 and bag2:
The bag contains 4 string(s), as follows:
A A B C

bag5, test the method difference of bag1 and bag2:
The bag contains 2 string(s), as follows:
A A
```
